OTHER SENSORS

- 1) IR Sensor : Detects presence of a person/animal, based on body heat

HCSR501 → Range = 10m at 120° angle

- 2) ULTRASONIC DISTANCE SENSOR : Measures distance of an object by sending ultrasonic waves

HCSR04 →

x Can work up to distance
Range of 400cm

WORKING : (i) Sensor sends a trigger by

Setting trigger pin to HIGH for 10µs

(ii) If object is present, ~~Echo pin~~ Echo pin will be high. The duration of HIGH on Echo determines the distance of an object

$$\text{Distance} = f(t)$$

~~t is measured with pulse in (fn)~~
~~pulse in (PIN)~~

In Arduino IDE

$$t = \text{pulseIn}(\text{PIN}, \text{HIGH})$$

↳ gives duration of Echo

CALCULATING DISTANCE

Speed of Sound (SOS) depends on temperature -

$$\text{SOS } 0^\circ\text{C} = 331.5 \text{ m/s}$$

$$\text{SOS } 20^\circ\text{C} = 343.5 \text{ m/s}$$

(room temp)

We need to convert to cm/us

$$\Rightarrow \text{SOS } 20^\circ\text{C} = 0.03435 \text{ cm/us} = \frac{1}{29.1} \text{ cm/us}$$

For sound travel for t ms

$$\text{distance} = \frac{t}{29.1} \text{ cm}$$

distance \Rightarrow Round trip
 to & from
 object

The signal
 Echoed travel
 back to sensor
 from object

The time to object is $t/2$

$$\Rightarrow \boxed{\text{distance} = \frac{t/2}{29.1} \text{ cm}}$$

3) SOUND sensor (Microphone)

POTENTIOMETER TO adjust sensitivity of digital pin response

• Ex:

Adjust sensitivity s.t
when a person starts
talking, DIGITAL PIN
will be HIGH & read
the analog values &
print them

• You can also get a
version of sound sensor
without digital pin
